Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

Disclosure; Fig 7; 605pp; English.

This invention describes a novel method for identifying an inhibitor copotentially useful for treatment of cancer, where the inhibitor is active con a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is consected to consect the condition, by administering to the patient having a precancerous condition, by administering to the patient a first allele consected to consected the consected to an allele of a first essential gene consected to an allele of a first essential gene consected to an allele of the patient are heterozygous for the first gene, the inhibitor consected to a population and tragets only one allelic forms of the gene commal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. concers, atherosclerotic plaques, premalignant metaplastic or dysplastic consecutions, benign tumours, endometriosis, polycystic kidney disease, and consecutions are consecutions. AAR25812-Z8625 represent consecutions are consecutions and consecutions and consecutions are consecutions. AAR25812-Z8625 represent consecutions are consecutions and consecutions and consecutions and consecutions are consecutions. polymorphic sites described in the method of the invention

MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also
                                                                              The present sequence represents a fragment of the multiple sclerosis (MS) associated retrovirus-1 (MSRV-1) DNA sequence. This sequence was used as a template to design a complementary 3 primer. The 3 primer was used during the synthesis of MSRV-1 CDNA which encoded a region of the MSRV-1 genome starting from the pol gene sequence and extending towards the gag gene. The invention provides complete or partial genomic sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;

                                                                Sequence 21 BP; 5 A; 7 C; 8 G; 1 T; 0 U; 0 Other;
                                                                                            AAV62907-V62927 are PCR primers used in the amplification of a human galactokinase. This protein is used in a method to detect galactokinase mutations. This protein and its encoding nucleic be used in methods allowing the detection, diagnosis and treatments.
                                                                                                                                                                       Detection of galactokinase mutations - gene sequence or altered galactokinase
                                                                                                                                                                                                                                                                                                                                                                                          Galactokinase; l deficiency: PCR
                                                                                                                                                                                                                                                                                                                                                                                                                         Human galactokinase cDNA PCR primer #15

Mutations of the HNF-1 alpha gene have been identified by amplifying (see AAV52632-51) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for non-insulin dependent diabetes mellitus (NIDDM) for use in diagnostics and therapeutics. It demonstrates that the MODY3 (maturity-onset diabetes of the young) locus is the HNF-1 alpha gene, Analysis of mutations in the

                                                                                                                                                                             This primer is used in the construction of a plasmid pIK.F7 is used in the construction of a retroviral packaging plasmid used for the production of high titres of recombinant retrovirus in human cells. The retroviral packaging plasmid comprises a retroviral helper DNA sequence derived from a replication-incompetent retroviral genome that encodes, in trans, all virion proteins required for packaging such a retroviral vector. The helper DNA sequence encodes a ecotropic Moloney murine leukaemia virus (MMLV) or gibbon ape leukaemia virus (GALV) gag and pol; and a xenotropic, amphotropic, ecotropic or polytropic envelope protein. The packaging plasmids, designated KAT plasmids, are used with a second retroviral vector encoding a foreign gene of interest to produce mammalian cells with retroviral supernatants that express, escued to produce the retroviral supernatants that constitutively the product of the packaging proven factor or coagulation factor. The plasmids are useful in construction of stable cell lines that constitutively the product of the product o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                              produce the retroviral proteins required in trans for the production of retrovirus particles: gag, pol and env. The stable producer cells continue to produce high titre retrovirus indefinitely in the absence of drug selection due to the stable integration of both packaging function and virus vector. The retroviral vector plasmids are constructed with sequences enabling the episomal persistence without the need for stable integration of the vector plasmid. The Env gene determines the host range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is an example of such a triple-helix forming oligomer. The oligonucleotide preferably binds to a sequence present in the plasmid to be purified, especially in a marker gene or the origin of replication

The retroviral packaging plasmids are used to transfect a cell which also comprises at least one retroviral helper DNA sequence derived from a replication incompetent retroviral genome. The helper sequence encodes in trans, all virion proteins required for packaging a replication-incompetent retroviral vector and for producing virion proteins which package the replication-incompetent retroviral vector. The retroviral DNA sequence does not encode the native enhancer and/or promoter of the viral 5' long terminal repeat (LTR), and lacks both the psi function sequence responsible for the packaging helper genome and the 3'LTR. The method can be used to transduce primary human realls in the force of the viral sequence to transduce primary human in the force of the packaging helper and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper than the sequence and the state of the packaging helper the sequence and the state of the packaging helper than the sequence and the sequence and the state of the packaging package the sequence and the sequence a

```
CC number of terminal repeat (TR) units. The LUR includes many conserved CC open reading frames (ORF). ORF K4 encodes vMIP-II which can inhibit CCR-5 CC dependent HIV-1 replication. The viral MIP (vMIP) like proteins have CC conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and and in unclaid acid are useful in standard hybridisation and immune assays for diagnosis of Kaposi sarcoma or for monitoring treatment. Antisense CC molecules and triplex forming oligonucleotides that hybridise to the KSHV CC mucleic acid, and antiviral agents that bind specifically to a KSHV CC polypeptide are used to treat Kaposi sarcoma. The antibodies can be used CC for treatment or prevention of the disease. The KSHV polypeptide is cueful in subunit vaccines and also to inhibit replication of human CC immunodeficiency virus. The KSHV nucleic acid may also be implicated in a commune of other lymphoproliferative diseases such as lymphomas, lymphatic CC leukaemias, splenomegaly, mycosis fungoides and the polypeptide is useful as an anti-inflammatory agent for treating autoimmune disease, especially constant of the correct OS field.)

Purification of double-stranded DNA to pharmaceutical ceramic hydroxy:apatite and affinity or ion-exchange particularly for plasmids intended for gene therapy. l purity - using
chromatography,

Disclosure; Page 37; 51pp; French.

This sequence represents a poly-CTT oligonucleotide used in a method of purifying double-stranded DNA to pharmaceutical purity, especially for use in gene or cellular therapy. The method comprises at least one stage of chromatography on a column of ceramic hydroxyapatite (HA), and anothes stage comprising an affinity chromatography purification, preferably with an immobilised oligonucleotide able to form a triple-helix structure. HA), and another preferably with

This primer is used for the PCR amplification of the vMIP-II region of the Kaposi sarcoma-associated herpes virus (KSHV or HHV8) genome sequence. The KSHV genome has a long unique region (LUR) flanked by a

acids, proteins, endotoxins, nucleases, etc. by passing the mixture over a support to which an oligonucleotide is covalently attached; the oligonucleotide is able to form a triple helix by hybridisation with a specific sequence present in the dsDNA. The present sequence is a preferred example of a suitable oligonucleotide which forms a triplehelix with a polyGAA sequence in dsDNA. The polyGAA sequence may be present naturally, e.g. in a plasmid origin of replication, or can be introduced artificially. The method is particularly suited to

The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozygous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual indentity and identifying disease susceptible individuals. See also AAQ26092-Q26367. (Updated on 25-MAR-2003 to correct PN field.)
       AAQ74334 and AAQ74335 are a pair of primers for the PCR amplification of the human mAb light chain V1 region, which was used in the construction of the plasmid pIK.K/L-int. The plasmid was constructed to direct the expression of a chimeric fusion protein for receptor associated signal transduction pathways. The chimeric DNA sequences could be used to modify lymphocytes and haematopoietic stem cells as precursors to a number of important cell types. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human mAB light chain V1 region; PCR primer; pIK.K/L-int; receptor associated signal transduction pathways; chimeri

                                                                                                            This primer is used in production of a retrovirus vector and packaging plasmid system. The primer is used, along with primer AAQ76241, to amplify an HIV gyd1 human monoclonal antibody IgG1 98.6 variable region light chain gene from plasmid pIK.98.6-kappa-FL, by polymerase chain reaction. A SalI site is placed at the 3'-end of the sequence, followed by ligation along with linkers AAQ76243-44 between EcoRI and BglII sites of plasmid pIK1.1, to give plasmid pIK.K/L-int. The resulting clone is used with heavy chain sequences to produce a single chain antibody and CD -4-zeta chimeric receptor gene in plasmid pIK.F5. This type of recombinant vector may be used along with new retrovirus packaging plasmids in a system for high-efficiency transduction of mammalian target cells with foreign genes (e.g. for gene therapy) by transient cotransfection of a packaging cell culture by a replication-incompetent helper plasmid and a recombinant vector, to produce high-titer with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21 BP; 2 A; 12 C; 1 G; 6 T; 0 U;

The agent is useful for preventing or treating diabetic nephropathy, chronic renal failure, nephritis, glomerulonephritis, interstitial renal disease, or gastrogenic oedema, and as a diagnostic agent for diagnosing these diseases. The present sequence is a PCR primer used in the
                                                                                                                                                                                                                                                                                                        Colony stimulating factor 1 receptor; CSF1R; polymorphic variant; cytostatic; gene therapy; malignant histicorytosis; isogene; myeloid malignancy; inflammatory disorder; transgenic animal; haplotype; genotype; human; allele specific oligonucleotide; ASO; primer; ss.
                       Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treating diabetic nepl
or gastrogenic edema,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a novel isolated polynucleotide (I) comprising a CC sequence which is a polynorphic variant (PV) of a reference sequence for CC colony stimulating factor 1 receptor (CSFIR) gene, found on The CC polypeptide are useful for improving the discovery and development of CC malignant histiccytosis, myeloid malignancies, and inflammatory disorders CC malignant histiccytosis, myeloid malignancies, and inflammatory disorders CC and the haplotypes can be used to validate CSFIR activity, e.g., and inflammatory disorders CC with CSFIR activity. Genotyping the CSFIR as a candidate target CC with CSFIR activity. Genotyping the CSFIR spendicted to be associated CC with CSFIR activity. Genotyping the CSFIR gene of an individual can also be used in developing diagnostic tests and therapeutic treatments. (I) is CC useful in studying the expression and function of CSFIR, and in CC expressing CSFIR protein for use in screening for candidate drugs to the variation on the biological activity and in studying the effect of the variation on the biological activity of CSFIR as well as on the CC binding affinity of candidate drugs targeting CSFIR. Antibodies are CC useful in a variety of diagnostic and prognostic formats and therapeutic can also the compounds. A transgenic animal is useful in studying expression of the CSFIR isogenes in vivo, for in vivo screening and testing of drugs targeted against CSFIR protein, and for testing the efficacy of the plenotypic effect of any particular CSFIR or haplotype the invention provides a method for identifying lead compounds that are more likely to show efficacy in clinical trials. This sequence is an allele specific CC oligonucleotide parimer used for detecting CSFIR gene polymorphisms, and the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human NOVX polypeptides and the polynucleotides cancoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzhelmer's disease, Parkinson's disease, graft-versus-host disease, scleroderma, hypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AlDS, dyslipidemia, cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in pareventive medicine or in pharmacogenomics. This sequence represents a preventive medicine or in pharmacogenomics. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc 'Nov' polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX colypeptide. The sequences are useful for disgnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, cdisease, scleroderma, hypertension, haemophilia, idiopathic clisease, scleroderma, hypertension, haemophilia, idiopathic chrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, cobesity, Crohn's disease, bronchial astima, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a CC primer used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The invention relates to an isolated polypeptide (designated NOVX, or CC NOV1-NOV127) comprising a sequence selected from 178 fully defined amino CC acid sequences (and their mature forms, variants and fragments). Also CC included are an isolated nucleic acid molecule encoding NOVX, a vector CC determining the presence or amount of the polypeptide or the nucleic acid molecule in or sample, methods for determining the presence of or CC predisposition to a disease associated with altered levels of expression CC if the above polypeptide or nucleic acid molecule in a first mammalian CC subject, a method for identifying an agent that binds to the above CC polypeptide, a method for identifying a potential therapeutic agent for CC expression or physiological interactions of the polypeptide, a method of a pathology that is related to aberrant CC expression or physiological interactions of the polypeptide, a method of CC expression or physiological interactions of the polypeptide, a method for modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating CC the activity of the polypeptide cited above. The composition and methods CC are useful for diagnosing, preventing or treating diseases such as CC cachexia, cancer, neurodegenerative diseases, anorexia, cancer-associated CC disbetes, obesity, infectious diseases. These may also be used in CC chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The polypeptides are also useful as vaccines. The CC pharmacogenomics is an RTO-PCR (real time quantitative PCR) primer used CC casent sequence is an RTO-PCR (real time quantitative PCR) primer used CC cases and tissue specific expression of a NOVX mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polynucleotide and the encoded polypeptide and composition are useful in treating or preventing NSCLC. This sequence corresponds to a primer for semi-quantitative PCR amplification of genes that are differentially expressed in NSCLC cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            30-SEP-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of a PCR primer for human cDNA (see ABV74192) encoding 19.5-like polypeptide (see ABP55070). It was used, with the primer given in ABV74196, to examine the expression profile of 19.5-like mRNA in human tissues. Expression was detected in gastrointestinal tissues including the colon, small intestine and stomach, with lower signals in the trachea, salivary gland and parotid. The invention provides 19.5 and 19.5-like nucleic acids, polypeptides a antibodies useful for the diagnosis, amelioration and/or treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid molecule encoding a 19.5 or 19.5-like polypeptide, useful for diagnosing, treating or ameliorating the of psoriasis, and in genetically or physically mapping the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            19.5-like polypeptide; psoriasis; gene therapy; antipsoriatic;

                                                                                                                 CC associated diseases which comprises a panel of nucleic acid primers
CC specifically priming and allowing amplification of each Vbeta gene,
CC vbetaRNA or cDNA. The kit is useful for disgnosing organ transplant
CC rejection and diagnosing and treating T-call associated diseases.
CC including autoimmune diseases, degenerative nervous system diseases,
CC graft versus host disease, hypersensitivity diseases, infectious diseases,
CC and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC allorgies and Alzheimer's disease. Hypersensitivity diseases include Type
CC I hypersensitivities such as contact with allergens that lead to
CC allorgies, Type II hypersensitivities such as those present in
CC allorgies, Type II hypersensitivities such as those caused by
CC manifested in leprosy. Infectious diseases include viral infections
CC caused by viruses such as HIV, fungal infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC schistosomes, liminative diseases include lymphoproliferative diseases
CC such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC breast. The present sequence represents a Vbeta gene repeat sequence.

                                                  The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid which comprises incubating a sample having the target nucleic acid which comprises in the presence of at least one first and second nucleic acid, where incubation produces amplified products, generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid and its absence indicates the absence of mutation in the target nucleic acid. The method and compositions of the invention may be useful for analysing mutation and diagnosing patients affected with PKD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was used to amplify human polycystic kidney disease PKD-1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         is useful for studying comparative human genomics of the genes related to acclimitisation to low oxygen at high altitudes and deep oceanic explorations. Rod gene probe is useful for studying comparative human genomics of the gene related to acclimitisation to low light like night blindness. The method efficiently identifies mycrophid larva and facilitates the assessment of water bodies, estimation of genetic resources and genetic variability between myctophid population. The present sequence is a species specific PCR primer for a mycrophid fish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analyzing mutations of a target from generated duplexes, useful polycystic kidney disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2003-897708/82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12-OCT-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26-FEB-2002; 2002US-00083246
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-AUG-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US2003152936-A1.

                                                                                                                                                                                  inhibit an angiogenic response, involving contacting an inactive pro form or convertase-activated form of an integrin alpha subunit, metalloprotease MTI-MWP and a candidate agent, under conditions which promote increased activation of the integrin subunit and correlating inhibition of increased activation with ability of the agent to inhibit angiogenesis. The method is used to screen for agents which inhibit an angiogenic response, and the agents are used in the treatment of associated diseases including cancer, macular degeneration, arthritis and retinopathies. The present sequence is a PCR primer used in the exemplification of the invention to identify angiogenesis inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer, macular degeneration and agents which inhibit activation of

                                                                                                                                                                                                                   CC the internally transcribed spacer region 2), PSL ROL (from the mitochondrial D-loop region), and ROD PSL SLMB (from the Rhodopsin gene). CC mitochondrial D-loop region), and ROD PSL SLMB (from the Rhodopsin gene). CC The gene regions for probe preparation are mitochondrial gene chosen from CC cytochrome b (Cytb), and mitochondrial control region (D-loop), 128 RNA cand 168 RNA genes, or nuclear gene chosen from rhodopsin (Rod) and CC internal transcribed spacer (ITS-2) gene. The method is useful for CC developing nucleotide probes for myctophid fishes such as Stenobrachius leucopsarus, Protomyctophum crockeri, Tarletonbaenia crenularis, CL Lampanyctus regalis, or Diaphus theta. The DNA probes are useful for CC chromosomal mapping of the myctophid species. The lantern fish primer CC sets and specific probes are useful in kit form. The species specific CC primers are useful to amplify a selected gene region to produce DNA CC primers are useful to amplify a selected gene region to produce DNA CC probe, which are directed as genetic markers. Cyt byrobe of myctophids CC is useful for studying comparative human genomics of the genes related to acclimitisation to low oxygen at high altitudes and deep oceanic CC explorations. Rod gene probe is useful for studying comparative human genomics of the gene related to acclimitisation to low light like night C facilities of the seasoner for water hodies estimation of constitution of most in the seasoner for water hodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to developing nucleotide probes for myctophid fishes by extracting fish NNA, amplifying NNA by selected primers, reamplifying DNA, purifying after cycle sequencing of eluted DNA, confirming sequence of target DNA, ligating DNA in vector, introducing vector into host, checking purity and specificity of cloned DNA probe, amplifying gene insert from probe, and designing species specific primers from the probe. Also included is the nucleotide base sequences of the amplified probes PSL CTYL (from the cytochrome B gene), PSL ITS2F (form the internally transcribed spacer region 2), PSL PSCL (from the cytochrome B gene).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Developing nucleotide probes for myctophid fishes by extracting fish DNA, amplifying DNA, preparing chimeric vector, introducing into host, confirming cloned probe DNA, and designing species specific primers from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Goswami U,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
The invention relates to developing nucleotide probes for myctophid CC fishes by extracting fish DNA, amplifying DNA by selected primers, CC reamplifying DNA, purifying after cycle sequencing of eluted DNA, CC confirming sequence of target DNA, ligating DNA in vector, introducing CC vector into host, checking purity and specificity of cloned DNA probe, CC amplifying gene insert from probe, and designing species specific primers CC from the probe. Also included is the nucleotide base sequences of the CC mitochondrial D-loop region), and ROD PSL SIMB (from the Rhodopsin gene). The internally transcribed spacer region 2), PSL PROL (from the Rhodopsin gene). The gene regions for probe preparation are mitochondrial gene chosen from CC cytochondrial D-loop region), and ROD PSL SIMB (from the Rhodopsin gene). The gene regions for probe preparation are mitochondrial gene chosen from CC cytochrome b (Cytb), and mitochondrial control region (D-loop), 12S RNA CC and 16S RNA genes, or nuclear gene chosen from rhodopsin (Rod) and CC internal transcribed spacer (ITS-2) gene. The method is useful for CC developing nucleotide probes for myctophid fishes such as Stenobrachius CC lampanyctus regalis, or Diaphus theta. The DNA probes are useful for CC chromosomal mapping of the myctophid species. The lantern fish primer CC sets and specific probes are useful in kit form. The species specific CC primers are useful to amplify a selected gene region to produce DNA probe of myctophids species. The produce DNA probe of myctophids of the myctophid species. The species specific Primers are useful to amplify a selected gene region to produce DNA probes of myctophids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                         to identify those that are promoted or inhibited in a given cell or tissue. The genes are preferably gene families such as the G protein coupled receptor family, tyrosine oxidase receptor family, or ion cha gene family. The methods may be used in treatment of cancers, includi prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be in the treatment and prevention of atherosclerosis, myocardial infarction, infarct or ischaemic disease of the brain. This polynucleotide sequence represents a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene expression
                                                                                     Sequence
                                                                                                                                                                                                                                    The invention relates to a novel method for gene expression analysis by collective quantitative analysis of the expression of a number of genes
                                                                                                                                                                                                                                                                                                                                                                                                           14-DEC-2001; 2001JP-00382053.

                                                                                                                                                        This invention describes a novel method of preparing a library of protein CC eproducing eukaryotic cells comprising (a) introducing specific cells comprising (a) introducing specific cells content on one of the chromosomal gene loci, (b) CC Expanding at least one of the modified cells, (c) Transfecting many cells expanded cells and (d) Integrating the DNA sequences into the gene loci on the basis of the recombination signals and the appropriate cells express different proteins, each from an cell content of the cell surface. The method is particularly used to produce libraries of humanized cell monoclonal antibodies, for selection of those with affinity for particular antigens and useful for diagnostic or therapeutic use. CC ibraries of Tigel receptors may also be prepared. The method produces cell receptors may also be prepared. The method produces cellscrion from a large number of proteins, allows relatively simple cellscration of the expressed gene (e.g. fusion to other protein-coding sequences), is suitable for large scale protein production and allows sequences not require incorporation of a resistance marker. This cell receptors may content production and allows requence represents a PCR primer used to amplify the genes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1664

                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to zcyto20, zcyto21, zcyto22, zcyto24 and zcyto25 polypeptides and polymucleotides. Sequences of the invention are useful for treating hairy cell leukaemia, renal cell or basal cell carcinoma, malignant melanoma, AIDS-related Kaposi's sarcoma, multiple myeloma, non Hodgkin's lymphoma, hepatitis B, C or D, infections (e.g. bacterial, fungal or protozoal) or myocarditis. The invention is useful for growth regulation in the liver, blood vessel formation and other developmental processes. The invention is also useful in immunotherapy and gene therapy. The present sequence is a PCR primer used to amplify human zcyto20 and zcyto22 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New ZCYTO20, ZCYTO21, ZCYTO22, ZCYTO24 and ZCYTO25 polypeptides and polynucleotides useful for treating leukemia, carcinoma, malignant melanoma, AIDS-related Kaposi's sarcoma, myeloma, non-Hodgkin's lymphoma, hepatitis and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hepatitis; infection growth regulation; deprimer; zcyto22; ss.

New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory CNS diseases.

SEQ ID NO 529; 772pp; English.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  identification of early and adult life history stages of myctophids i.e., Lantern fishes. The specifies specific primers are employed to amplify a selected gene region to produce DNA probe directed for use as genetic markers. The probes are useful for identifying myctophid larvae and hence facilitate the assessment of genetic resources and genetic variability between myctophid population. use of the primer polymucleotides for amplifying a myctophid gene or its fragment. The present sequence represents a specifically claimed Protomyctophum crockeri PCR primer, which is used in the method from the present invention

                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                     cc antidabetic, antiinferrility, haemostatic, antiinflammatory, anti-NIV.
CC antidabetic, antiinferrility, haemostatic, antiinflammatory, anti-NIV.
CC antidabetic, metabolic, immunomodulator, neuroprotective, nootropic,
CC antidasthmatic, metabolic, immunomodulator, neuroprotective, nootropic,
CC antiparkinsonian and antilipaemic activities, and can be used in gene
CC therapy. NOVX proteins are useful for treating or preventing a pathology
CC associated with the human disease. NOVX nucleic acids, proteins and
CC antibodies can be used in the treatment and diagnosis of cardiomyopathy,
CC atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
CC valve disease, tuberous sclerosis, scleroderma, obesity, transplantation,
CC congenital adrenal hyperplasia, prostate cancer, fertility, haemophilia,
CC disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,
CC disease, AIDS, bronchial asthma, Crohm's disease, multiple sclerosis,
CC disease, AIDS, bronchial asthma, Crohm's disease, multiple sclerosis,
CC disease, AIDS, bronchial asthma, Cancer associated cachexia, cancer,
CC Alzheimer's disease, parkinson's disease, immune disorders
CC haematopoietic disorders, dyslipidaemias, and metabolic syndrome X.
CC ACC346 to ACC6245 represent PCR primers and probes for human NOVX
CC sequences, which are used in examples from the present invention with
CC the human NOV35b protein in the exemplification of the present invention
CC the human NOV35b protein in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62345 to ACC62345 encode the human NOVX proteins given in ABR54176. NOVX sequences have anniatherosclerotic, cardiant, heartfall of the ABR54276. NOVX sequences have anniatherosclerotic, cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hypotensive, dermatological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an immune response, particularly an autoimmune disease. The zinc finger polypeptide or a nucleic acid encoding such a polypeptide can be used to modulate transcription of a receptor nucleotide sequence. The nucleic acid polypeptide capable of binding to a nucleic acid sequence comprising a receptor nucleotide sequence, where the receptor is capable of functioning as a receptor for infection by the virus or is involved in an immune response, or a nucleic acid encoding such a polypeptide, can be used in the preparation of a medicament for use in the treatment or prevention of a disease caused by a virus or of a disease associated with an immune response. The polypeptides may further be used to treat or prevent various diseases or syndromes associated with or caused by malfunction of the receptor as the TNPR1 receptor, such as autoimmune disease including inflammation, autoimmune encephalomyelitis, rheumatoid arthritis or myocarditis. The present nucleic acid sequence represents a TNPR1 six finger domain sequence, as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The nucleic acid polypeptide capable of binding to a nucleic acid sequence compris a receptor nucleotide sequence, where the receptor is capable of functioning as a receptor for infection by the virus or is involved in immune response, or a nucleic acid encoding such a polypeptide, can be used in the preparation of a medicament for use in the treatment or prevention of a disease caused by a virus or of a disease associated w an immune response. The polypeptides may further be used to treat or prevent various diseases or syndromes associated with or caused by malfunction of the receptor as the TNFR1 receptor, such as autoimmune diseases including inflammation, autoimmune encephalomyelitis, rheumat arthritis or myocarditis. The present nucleic acid sequence represents

XX GOWANPR 30-MARXX GOWANXX GOW The present invention describes a method (M1) for developing probes (P) for myctophid fish by amplifying selected gene regions in DNA extracted from muscle of fish, eluting and reamplifying amplified DNA, purifying and ligating the DNA into vector which is transformed into host cells, purifying recombinant plasmid DNA having cloned gene (P) from host cells, amplifying gene insert from probe, comparing sequence of prepared (P) against known sequences of similar genes, and designing gene insert from sequences of set a section of the section sequences. The method is useful for developing nucleotide probes for myctophid fishes such as Stenobrachius leucopsarus, Diaphus theta. Protomyctophum crockeri, Tarletonbeania crenularis or Lampanyctus

function as a receptor for virus interceptor. The molecules of the invention are useful in the treatment or response. The molecules of the invention are useful in the treatment or prevention of a disease caused by a virus or of a disease associated with an immune response, particularly an autoimmune disease. The zinc finger polypeptide or a nucleic acid encoding such a polypeptide can be used to

ne present invention relates to a new polypeptide capable of l nucleic acid comprising a receptor nucleotide sequence which unction as a receptor for virus infection or is involved in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC receptor and soluble or membrane bound CTLA-4 receptor. The invention CC also relates to a vaccine comprising an effective amount of these corrector proteins. A vaccine is useful for inducing immunity or enhancing CC an immune response in a cat. The protein sequences of the invention are useful for suppressing an immune response in a feline suffering from an catuchimune disease or the recipient of a tissue or organ transplant. A CC vector containing the DNA sequences of the invention is useful for redirecting an immune response in a feline to an immunogen such as rabies CC virus, chlamydia, toxoplasmosis gondii, flea, feline immunodeficiency CC virus, feline leukaemia (FeLV), feline infectious peritonitis virus (FIP), panleukopaenia virus, calcivirus, reovirus type 3, rocavirus, cornavirus, syncitial virus, herpes virus, sarcoma virus, borna disease CC cornavirus, syncitial virus, herpes virus, sarcoma virus, borna disease CC cornavirus, parasite. The protein sequences may be further utilised to promote growth in homologous or heterologous feline species. Enhancement CC immunity through the interaction of soluble CD80 or Soluble CD86 with CCD28 or CTLA-4 or inhibition of an immune response through the CC interaction of feline CD80 or CD86 with CTLA-4 takes advantage of the natural process of regulation rather than adding foreign substances that CC could have multiple, even detrimental effects on overall or long term CC quantitative PCR experiments to analyse expression of different cytokines and the nucleotide sequences of the invention from infected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                   sequencing DNA. The method involves identifying two nucleotides which are separated by an interval in double stranded (ds) nucleic acid using restriction endonuclease that generates 5' overhang, template-directed ligation to labeled adaptors and amplification. The method is useful for identifying a first nucleotide n and a second nucleotide n+x in a ds nucleic acid segment which is a genomic DNA, cDNA, a product of an in vitro DNA amplification e.g., a polymerase chain reaction (PCR) product or a product of a strand displacement amplification, or a vector insert. It is also useful for sequencing an interval within a ds nucleic acid segment in several of staggered ds molecules produced from the double stranded nucleic acid segment. It is useful for removing all or a part of a primer sequence from a primer extended product and for automated sequencing of double-stranded DNA segments. The present sequence is a PCR primer used to illustrate the method of the invention

```

The present invention relates to a new polypeptide capable of binding a nucleic acid comprising a receptor nucleotide sequence which can function as a receptor for virus infection or is involved in an immune response. The molecules of the invention are useful in the treatment of prevention of a disease caused by a virus or of a disease associated we New polypeptide capable of binding nucleic acids for treating or preventing a disease caused by a virus or a disease associated with immune response, particularly autoimmune diseases e.g. inflammation rheumatoid arthritis. Example u I Page 63; 105pp; English. an immune ő

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention are used or gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX9753 represent PCR primers and probes used in the amplification and isolation of the NOVX polynuclectides represented in ABX97186-ABX97185 which encode the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, and male inferrility. Sequences appecifically dilated cardiomyopathy, and male inferrility. Sequences ABK41510-ABK4159 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC expressible selectable marker and modifying other allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous crecombination, of a promoter replacement fragment with a heterologous crecombination, of a promoter replacement fragment with a heterologous creation of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal contributes both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian constituty of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, constituty. The method is useful for identifying a compound which modulates the activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence data for this patent is not represented in the printed specification but is based on account is not represented in the printed specification but is based.

                                                                                                                                                                                                                with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CTYPtase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The cligonuclectides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor; interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The creptor increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with hyper-responsiveness to inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, creating respiratory or lung disease (CDP), chronic obstructive pulmonary disease (CDPD),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located on chromosome 9, more specifically to CC 9934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonuclectides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, and can antisense compounds have cytostatic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The method comprises (a) introducing at least two different DNA CC constructs into a population of cells, using at least one construct for each gene, where the construct has at least one sequence of sufficient CC enforcement and homology to undergo homologous recombination with the CC chromosomal sequences and (b) selecting cells in which at least two genes CC have been altered by homologous recombination. The moss described is of CC californica, P. readeri or P. patens. Typical of many genes that can be CC targeted are those that encode storage proteins, proteins of the CC thiosetcrases, phosphorylases, chalcone isomerases, cellulases and CC threonine synthase. The constructs have a linear, or linearised, CC structure and include at least one positive or negative selection marker CC or reporter gene. The altered cells (or organisms regenerated from them) CC are used for production of food, animal feed, pharmaceuticals and fine CC chemicals (e.g. enzymes, vitamins, amino or fatty acids, sugars, CC oils, fatty acids, starch, tocopherols, tocotrienols and carotenolds). CC oils, fatty acids starch, tocopherols, tocotrienols and carotenolds. CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, sugars, CC oils, fatty acids, starch, tocopherols, tocotrienols and carotenolds). CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, sugars, CC oils, fatty acids, starch, tocopherols, tocotrienols and carotenolds). CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, sugars, CC offeducals, starch, tocopherols, tocotrienols and carotenolds). CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, sugars, CC offeducals). CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, collidered at a collidered collidered acids). CC offeducals (e.g. enzymes, vitamins, amino or fatty acids, collidered acids) (e.g. enzymes, vitamins, amino or fatty acids, collidered acids). CC offeducals (e.g. enzymes, vitamins, amino or fatt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpGES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; immunomodulator; cardiant; neuroprotective; antiinflammatory; immunomodulatory; cardiovascular; gene therapy; inflammation; hlzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;

The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides compounds have cytostatic, antisense oligonucleotides are contained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) anticana.
